Mr2 LABS

THE DEFINITIVE FOUNDER'S GUIDE | MOHAMEDRASHARD.DEV

72-HOUR MVP BLUEPRINT

Ship a working, live product in 48 to 72 hours. The exact framework used by Mohamed Rashard.

48-72 hrs	5-phase	Zero
TO LIVE PRODUCT	BUILD SYSTEM	BS INCLUDED

Mohamed Rashard Rizmi

Full-Stack AI Engineer | Colombo, Sri Lanka

I have shipped working MVPs in under 48 hours. Not as a stunt, but as a repeatable system. This blueprint is the exact framework I use: how I scope, how I build, what I skip, and how I hand off a live product that real users can interact with on day 3.

FIRST CLASS HONOURS | AI ENGINEER | 48HR MVP SPECIALIST

What you will get from this blueprint:

- The 5-phase system I use for every MVP build
- The tech stack decisions that save 20+ hours
- The 48-hour day-by-day build schedule
- How to scope an MVP in under 30 minutes
- What to skip and features that kill launch speed
- The system to turn your MVP into paying clients

PART 01 FOUNDATION

Scope or Die

The build starts before you write a single line of code.

PHASE 1 THE 30-MINUTE SCOPE (HOURS 0-1)

Most MVPs fail before a single line of code is written. They fail because the founder tried to build everything. An MVP is not version 1 of your product. It is the smallest possible thing that proves your core assumption.

THE ONE-SENTENCE TEST

"My MVP helps [specific person] do [specific thing] so they can [specific outcome]."

Example: "My MVP helps SaaS founders track churn so they can reduce cancellations by 20%."
If you cannot fill in all three blanks in 60 seconds, stop. Define them first.

The 3 iron rules of MVP scope:

RULE 1

One problem only.

Every feature you add doubles your build time. Pick the single most painful problem and build only that. Everything else is v2.

RULE 2

No nice-to-haves.

User profiles, dashboards, admin panels — none of these belong in an MVP. Can someone experience the core value without it? If yes, cut it.

RULE 3

Define "done" before you start.

Write down what shipped looks like. A live URL. A user can sign up. A user can do the one core thing. Anything beyond that is scope creep.

PHASE 2 STACK DECISIONS (HOURS 1-3)

The right stack is the one you can ship in 48 hours. Choosing the wrong stack is the fastest way to miss your deadline.

AI WEB APP

Next.js + Python + Supabase

Best for AI chatbots, automation tools, lead gen.

SAAS PLATFORM

Next.js + Node.js + Stripe

Best for subscription tools, dashboards, B2B.

MOBILE MVP

React Native + Expo + Firebase

Best for iOS/Android using one codebase.

LANDING + FORM

Next.js + Resend + Supabase

Best for validating demand before building.

PART 02 EXECUTION

The 48-Hour Clock

Hour-by-hour. No fluff. This is what the build actually looks like.

HOURS 0-1

Scope lock

- Write your one-sentence MVP statement
- List every feature, then cut 70% of it
- Define what "done" looks like
- Set up repo, env, and deploy pipeline now

HOURS 1-6

Foundation

- Initialize project with chosen framework
- Set up database schema - only tables you need
- Build auth (use Supabase Auth)
- Deploy a skeleton app to your domain

HOURS 6-18

Core feature build

- Build only the feature that delivers value
- AI integrations: connect, test, handle errors
- No styling yet - function first
- Every new idea goes in a backlog doc

HOURS 18-30

UI and flow polish

- Add Tailwind - make it look real
- Build full user flow (landing to core action)
- Add loading and empty states
- Test on mobile - use responsive classes

HOURS 30-40

Integration and data

- Connect payments (Stripe) and email (Resend)
- Set up error logging (Sentry free tier)
- Seed database with realistic test data
- Do a full end-to-end walkthrough

HOURS 40-48

Launch prep

- Deploy to production (Vercel/Railway)
- Set up custom domain and SSL
- Record a 3-minute Loom walkthrough
- Send URL to your first 5 potential users

What to skip entirely in an MVP build

- x Admin panel
- x User roles and permissions
- x Email verification
- x Notification system
- x Analytics dashboard
- x Dark mode toggle
- x Onboarding tours
- x Social logins (Google/Apple)
- x Automated tests

PART 03 INTELLIGENCE

Adding AI Without Losing Speed

The rule: use APIs, never train models. Let OpenAI and Anthropic do the heavy lifting.

Chatbot / Assistant

GPT-4O OR CLAUDE SONNET

- System prompt defines persona and data
- Stream responses for perceived speed
- Store conversation history in Supabase
- Add a feedback button (thumbs up/down)

Lead Qualification

OPENAI + STRUCTURED OUTPUTS

- Ask AI to score leads on defined criteria
- Return JSON with score, reason, and action
- Trigger automated emails via Resend
- Log every decision for manual review

Content Generation

GPT-4O OR CLAUDE HAIKU

- Define output format strictly in prompt
- Validate output before showing to users
- Add regenerate button (expect imperfection)
- Cache generations to reduce API costs

Data Analysis

PYTHON + FUNCTION CALLING

- Send structured data as context in prompt
- Use function calling for JSON outputs
- Build with FastAPI deploy to Railway
- Add clear loading states (takes 3-5 seconds)

Non-negotiable AI rules for MVPs

RULE 01 **Always handle API errors gracefully.** AI APIs fail. Add try/catch everywhere and show a fallback.

RULE 02 **Set token limits.** Unbounded prompts equal unbounded costs. Set max_tokens on every call.

RULE 03 **Never expose keys on the frontend.** All AI calls go through your backend. Never call OpenAI from the browser.

RULE 04 **Build a kill switch.** Add an environment variable to disable AI instantly if costs spike.

The Launch Checklist

Everything that must be true before you share the URL.

Technical

- [ ] App is deployed to production
- [ ] Custom domain is live with SSL
- [ ] All environment variables are set
- [ ] Error logging is set up (Sentry)
- [ ] No console errors in production

User Experience

- [ ] New user can complete core action in under 2 minutes
- [ ] Error states show human-readable messages
- [ ] Loading states exist for async operations
- [ ] App works smoothly on mobile
- [ ] CTA is visible above the fold on key pages

Business

- [ ] Analytics is tracking (Plausible/GA)
- [ ] A way to collect user email exists
- [ ] Payment processing works end-to-end
- [ ] Recorded a 3-minute Loom demo
- [ ] First 5 target users have the URL

Post-Launch

- [ ] Check analytics every day for 7 days
- [ ] Reply to all feedback within 24 hours
- [ ] Document bugs fix the top 3 first
- [ ] Interview at least 3 users in week 1
- [ ] Decide: pivot, iterate, or double down

The Launch Mindset

- Launching a broken product to 5 people is better than launching a perfect product to nobody.
- Your MVP will have bugs. Users will find things you missed. That is the entire point.
- The goal of the MVP is not to impress. It is to learn. Ship it, watch what happens, and build v2.
- The founders who win are not the ones who built the best first version. They are the ones who shipped first and iterated fastest.

PART 05 GROWTH

From MVP to Paying Clients

The follow-up system that turns a launched product into revenue.

You shipped. You have a live URL. Now what? The MVP itself is the best sales tool you have. Here is how to turn that live product into client conversations, case studies, and revenue.

01 Record a 3-minute Loom

Walk through the product as if showing it to an investor. What it does. The problem it solves. The core action. Keep it under 3 minutes. A Loom link in a cold email gets 3x more replies.

02 Write the case study now

Do not wait for a client. Write the case study for your own MVP. "Built BizFinder AI reduced lead research from 5 hours to 10 minutes." Add it to your website today.

03 Share it everywhere once

One LinkedIn post. One tweet. One Reddit post in a relevant community. Post with a link to the live product and the Loom video. Then let it work.

04 DM 10 people directly

"Hey, I just shipped something that solves [problem]. Here is the live link. Would love to know what you think." Direct, personal, not a pitch. People engage with builders.

05 Offer to build theirs

"I built this for myself in 48 hours. I can do the same for your business. Want to see what that looks like?" This is your CTA. It converts because the proof is already there.

Rather have me build it for you?

I ship working MVPs in 48 to 72 hours. You get a live product, a real URL, and a tool you can show investors and users on day 3.
